

### **DooKaddy™ Below Ground Installation Directions**

Select a convenient area in your yard away from any home garden or underground water source. Dig hole approximately 20" - 24" deep. The hole should be slightly bigger than the shape of the DooKaddy. Line the bottom of the hole with river rock or gravel (not included) to ensure proper drainage.

Set the DooKaddy in the hole using the corners of the unit to anchor the receptacle in the dirt. Bury DooKaddy being sure to pack soil and additional river rock or gravel around all sides and bottom of receptacle. The top 2" of the DooKaddy should be above ground. This allows you to use the foot lever to lift the lid.

Once in ground, deposit dog waste, sprinkle with DooKashi to cover and add 1 gallon of water to accelerate the waste decomposition process. Re-apply DooKashi each time waste is deposited and 1 gallon of water weekly. By treating poo with DooKashi™ Pet Waste Culture Mix, the draining liquid is absolutely safe for the soil.

Why? Because DooKashi contains a certified organic probiotic of beneficial bacteria that eliminates odor and reduces harmful pathogens found in dog waste. It is 100% natural and safe for human and animal contact. *See website for additional directions.*

Other recommendations:

- Have a strong kid dig the hole: our 13,14 & 15 year old boys did this easily
- Do supervise the digging just in case they decide to have a dirt fight (ours did!)
- Decomposition of waste is dependent on size of dog, type of food consumed and amount of waste
- Keep the lid of the DooKaddy closed other than when adding poo. Sunshine is not required to dry out the poo – that's what DooKashi™ is for!

The DooKaddy™ and DooKashi™ are produced by EcoPet Waste Systems
